220 v / 50/60Hz

# RINA

- 1.** Connect the machine to the running water system (you can also connect it to a carafe or a large water can).
- 2.** Connect the drain box with the crystal PVC hose to the drain tube or, in case you don't have one, to a carafe or an empty large can.
- 3.** Connect the machine to the wall socket and turn on the switch. The water will go into the boiler until it reaches its level, 3/4 of the indicator tube, automatically. The red light in the switchboard will turn on (  ), indicating the resistance is working. You have to wait until the machine heats up, then the manometer will reach to 1 bar approximately; and in that moment the red light will turn off, which indicates that it is ready to operate. This red light will turn on every time the machine needs to recuperate temperature. If the green light is turned on this doesn't prevent to operate normally the machine in all its functions.
- 4.** Once completed all the above mentioned, you can start making coffee. You will have to let the water run with the filter holders in so that it can reach temperature pressing the group switch. Load the filter holder with the ground coffee, completing its capacity and then press it with the coffee press (which is in the mill). If the grinding is correct, the coffee will come out creamy and will fill the cups in approximately 30 seconds. If not, you will have to correct the grinding (see grinder indications).

Note: The electropump manometer will go up 9 bar approximately each time a coffee is made.

### Gringer regulation

To regulate the coffee grinder you have to turn round the register.

**Screwing in the register - finer coffee** ↺ ↻

**Unscrewing the register - thicker coffee.** ↻ ↺

### Attention!:

- 1) If the coffee runs out too slow, the grinder is too fine.
- 2) If the coffee runs out too fast, the grinder is too thick.
